Sieving for perfect quality control
PARTICLE SIZING

The widest range of sieving equipment in the world!

RETSCH’s line of sieving machines not only covers a wide measuring range. Thanks to various sieving motions and sieve sizes it is possible to select the ideal instrument for practically any bulk material. The instruments produce exact and reproducible results and comply with the requirements for the test materials monitoring according to DIN EN ISO 9000 ff.

Why particle size analysis?

The knowledge of particle size and distribution in disperse systems is very important for research and development, production and quality assurance.

The following list shows product properties that depend on the particle size distribution:

- mechanical properties of bulk goods
- surface reaction
- insulating and absorbing properties
- flavor
- mixability
- wear resistance
- filtration ability
- stress and breaking behavior
- agglomeration due to adhesive forces
- conductivity
- extinction

Innovative technology that sets standards worldwide!

RETSCH analytical vibratory sieve shakers are used in research & development, quality control of raw materials, interim and finished products as well as in production monitoring. The three-stage series AS 200 provides a suitable instrument for every requirement and budget.

The AS 300 control is designed for larger feed quantities up to 6 kg whereas the AS 450 control is the ideal sieve shaker for even higher loads up to 25 kg.

All of them are suitable for dry and wet sieving. The patented electromagnetic drive of these sieve shakers produces a 3-D throwing motion which ensures optimum use of the open sieve area and lets the sample move equally over the whole sieving surface. The “control” instruments feature digital amplitude adjustment which allows for sharp fractionizing of the sample even after very short sieving times. These models can be used as measuring instruments according to DIN EN ISO 9000 ff.

Vibratory Sieve Shakers

AS 200 basic / digit

The economical alternative of the series with familiar RETSCH quality and reliability. With analog adjustment of vibration height and sieving time.

AS 200 digit

The standard model of the AS 200 series is recommended whenever digital time display, interval operation and analog adjustment along with optical monitoring of the vibration height are required.
Vibratory Sieve Shaker
AS 200 control

AS 200 control with clamping device "comfort" and sieve stack

The AS 200 control complies with the highest requirements in quality assurance. One particular characteristic makes this RETSCH product stand out from others: Instead of the vibration height, the sieve acceleration, which is independent of the power frequency, can be set. Thus, the AS 200 control ensures comparable and reproducible sieving results worldwide. It can be calibrated to ensure 100% reproducibility of sieving results, not only in one device, but among all AS 200 control units! Thus, the requirement for the test materials monitoring according to DIN EN ISO 9000 ff is met. Its microprocessor-controlled measuring and control unit ensures a constant vibration height. Operation of the AS 200 control is convenient and easy. All sieving parameters – vibration height, time, interval – are set, displayed and monitored digitally. Up to 9 parameter combinations (SOPs) can be stored for routine analyses. Through the integrated interface the instrument can be connected to a PC and controlled with the evaluation software EasySieve®. This program enables the user to control the whole sieving process and the subsequent documentation with convenience and accuracy.

All RETSCH Sieve Shakers can be combined with various sieve clamping units. For frequent sieving processes, we recommend the user-friendly quick clamping unit "comfort".

Benefits at a glance
- Sieving with 3-D effect
- For sieves up to 203 mm (8") Ø
- Measuring range 20 µm to 25 mm
- Suitable for dry and wet sieving
- Available in 3 versions
- Easy operation, ergonomic sieving
- Low noise and maintenance-free

Technology of AS 200, AS 300, AS 450

All Sieve Shakers of the series AS 200, AS 300 and AS 450 work with an electromagnetic drive that is patented by RETSCH (EP 0642844). This drive produces a 3-D throwing motion that moves the product to be sieved equally over the whole sieving surface. The advantage: high load capacity, extremely smooth operation and short sieving times with high separation efficiency.

Furthermore, this patented RETSCH drive runs without wear and does not require maintenance.
The worldwide unique RETSCH technology: sieving with controlled acceleration!

The Sieve Shakers AS 200 control and AS 300 control are activated in their natural frequency. This means, the sieving frequency changes with the load of the instrument. It depends on the weight of the sieve stack and the quantity of the loaded product to be sieved. In order to ensure the reproducibility of the results even in short-time sieving procedures, the default setting of the vibration height can be switched to sieve acceleration (sieving with equal acceleration).

The Sieve Shaker AS 450 control works at a specially aligned stabilized frequency. Thus, these instruments work completely independent of operational parameters such as power frequency, loading, age, or condition of the unit.

Therefore, the RETSCH Sieve Shakers AS 200 control, AS 300 control and AS 450 control are the only sieve shakers to feature the possibility of eliminating influences of error by different sieving frequencies via automatic adjustment of the amplitude (patents D 19 522 987, USA 5,791,494). An amplitude of up to 3 mm can be achieved under all nominal load conditions, and the sieve acceleration achieved can be as high as 21 g (1 g = 9.81 m/s²).

The AS 300 control is specifically designed for test sieves with a diameter of 305 mm (12")/315 mm. Compared to sieves with a diameter of 200 mm, a 2.25 times larger sieving surface is thus available. Therefore, the average sieving times can be greatly reduced with the AS 300 control. Another advantage is the large feed quantity (up to 6 kg) that can be separated in one working run. Repetitive operations can be greatly simplified with the possibility to store up to 9 parameter combinations directly in the sieving instrument.

The AS 300 control can be calibrated, and is thus suitable for test materials monitoring according to DIN EN ISO 9000 ff. Like all instruments of the series “control”, the AS 300 has an integrated interface. Using the evaluation software EasySieve®, the instrument can be controlled and adjusted. With EasySieve®, all sieving parameters are displayed on screen before and during the sieving process.

Benefits at a glance
- Sieving with 3-D effect
- For sieves up to 315 mm Ø
- Measuring range 20 µm to 40 mm
- Suitable for dry and wet sieving
- 9 SOPs can be stored
- Short sieving times with large sieving surface and effective movement of the product to be sieved
- Low noise and maintenance-free
With the Vibratory Sieve Shaker AS 450 control RETSCH has designed its first siever for 400 mm and 450 mm sieves which operates with a three-dimensional sieving motion. It can be used for dry and wet sieving of sample amounts of up to 25 kg in one working run. With the AS 450 control RETSCH has now combined the benefits of electromagnetic sieving – controlled amplitude with highest reproducibility – with the powerful drive based on the CET technology (Continuous Energy Transformation). The continuous and controlled energy input allows for constant amplitudes of up to 2.2 mm which results in a high separation efficiency, even with high loads, so that manual re-sieving becomes obsolete. The AS 450 control is particularly suitable for materials such as minerals, ores, construction materials, coal or soils. Like all instruments of the “control” series, the AS 450 can be controlled with the evaluation software EasySieve®.

When it comes to operating comfort, the AS 450 control meets all the requirements of a modern laboratory. All parameters such as amplitude, time and interval are digitally set, displayed and controlled via a remote operation panel. It is possible to store up to 9 parameter combinations for routine tasks.

Benefits at a glance
- Sieving with 3-D effect
- For sieves up to 450 mm Ø
- Measuring range 25 µm to 125 mm
- Suitable for dry and wet sieving
- 9 SOPs can be stored
- High sieve loads (up to 25 kg)
- Excellent separation efficiency even with short sieving times
- With remote operation panel

AS 450 basic
With the AS 450 basic, RETSCH offers a budget-priced alternative to the AS 450 control sieve shaker. The sieve shaker covers a size range from 25 µm to 125 mm and accepts loads of up to 15 kg. Time and amplitude are digitally set which ensures reproducibility of the sieving process. The AS 450 basic is suitable for dry sieving. It is the economic solution for users who need to sieve larger quantities of dry material with reliable results.

### Technical data

- Suitable sieve diameters: 100 mm to 200 mm / 8" up to 450 mm, 400 mm and 450 mm
- Height of sieve stack: up to 450 mm, up to 963 mm
- W x H x D: 400 x 230 x 350 mm, 400 x 235 x 400 mm
- Net weight: approx. 30 kg, approx. 35 kg, approx. 140 kg, approx. 200 kg
- Measuring conditions: 5 test sieves; vibration height 1.5 mm (AS 200/AS 300), 1.1 mm (AS 450); feed material quartz sand; particle size <1 mm

### Wet sieving with Vibratory Sieve Shakers

There are many applications for which wet sieving is the best solution, e.g. when the material to be tested is a suspension or when a very fine sample (< 45 µm) that tends to agglomerate has to be sieved.

All Vibratory Sieve Shakers – AS 200, AS 300 and AS 450 control – can be used for wet sieving. There are special accessories like clamping lids with spray nozzle and collecting pans with outlet available. By placing RETSCH’s venting rings between the sieves, air cushions can expand without letting liquid or sample material escape.

For additional accessories such as evaluation software, test sieves, sieve lids, collecting pans, sieving aids etc. please refer to our website www.retsch.com
Horizontal Sieve Shaker
AS 400 control

The base plate performs horizontal circular motions with a radius of 15 mm (according to DIN 53477). The speed of 50 to 300 rpm is electronically controlled. It is continuously adjustable to meet the requirements of the product to be sieved. The actual value of the number of revolutions is digitally displayed. The base plate is driven by a robust, maintenance-free drive motor with a power of 125 Watt. The power is transmitted via an eccentric.

9 sieving programs can be directly stored for routine analyses. An integrated counter mass ensures stability even with a high mass of the sieve stack. It is possible to secure the instrument to the laboratory bench if desired. The base plate can take very high loads due to 4 eccentric guides. The AS 400 control has an integrated interface for controlling all sieving parameters via the EasySieve® software.

Benefits at a glance
- Circular sieving motion according to DIN 53477
- For sieves up to 400 mm Ø
- Measuring range 45 µm to 63 mm
- Easy operation, ergonomic design
- Low noise and maintenance-free

Technology of the AS 400

The AS 400 control can be used as a test instrument for the quality control according to DIN EN ISO 9000 ff. Due to the controlled drive the AS 400 control yields reproducible results worldwide. The desired number of revolutions / sieve acceleration and sieving time are set, displayed and monitored digitally. The instrument is supplied with a test certificate and can be recalibrated. If desired, the rotation direction can be set to alternate in the interval. Up to 9 sieving programs can be directly stored for routine analyses. An integrated counter mass ensures stability even with a high mass of the sieve stack. It is possible to secure the instrument to the laboratory bench if desired. The base plate can take very high loads due to 4 eccentric guides. The AS 400 control has an integrated interface for controlling all sieving parameters via the EasySieve® software.

- Measuring range 45 µm to 63 mm
- Easy operation, ergonomic design
- Low noise and maintenance-free

Technology of the AS 400

The AS 400 control can be used as a test instrument for the quality control according to DIN EN ISO 9000 ff. Due to the controlled drive the AS 400 control yields reproducible results worldwide. The desired number of revolutions / sieve acceleration and sieving time are set, displayed and monitored digitally. The instrument is supplied with a test certificate and can be recalibrated. If desired, the rotation direction can be set to alternate in the interval. Up to 9 sieving programs can be directly stored for routine analyses. An integrated counter mass ensures stability even with a high mass of the sieve stack. It is possible to secure the instrument to the laboratory bench if desired. The base plate can take very high loads due to 4 eccentric guides. The AS 400 control has an integrated interface for controlling all sieving parameters via the EasySieve® software.

Benefits at a glance
- Circular sieving motion according to DIN 53477
- For sieves up to 400 mm Ø
- Measuring range 45 µm to 63 mm
- Easy operation, ergonomic design
- Low noise and maintenance-free

Horizontal circular sieving motion

The RETSCH AS 400 control is used for the sieving of dry goods with test sieves of a diameter up to 400 mm. The horizontal circular sieving motion is preferably used for long or fibrous, needle-shaped flat materials. The horizontal orientation of the particles allows for better reproducibility of the sieving results. Fine and coarse-grained goods as found in the areas of milling, brewing, chemical industry, quarries, soil testing, woodworking and plastics industry, can be exactly separated with the AS 400 control. For the testing of plastics (grainy moulding materials), the DIN 53 477 even requires the circular sieving motion.
As reliable sieving results do not just depend on the sieve but are also influenced by the sieving time and sieve movements, it is extremely advisable to recalibrate the sieve shaker used within the framework of test agent monitoring. Reproducible sieving parameters are an essential precondition for assigning variations in the analysis results unambiguously to the sample and showing that they are not caused, for example, by inaccurate sieve shaker settings. During calibration within the context of quality assurance as per ISO 9000, all the relevant parameters of the control sieve shakers are checked and, if necessary, adjusted. Its proper condition is confirmed by an inspection certificate as per EN 10204 3.1B.

The AS 400 control is a robust device, which meets highest requirements due to its superior technology. With the option to install clamping devices for sieves with diameters from 100 mm to 400 mm (4" to 16") the AS 400 is particularly versatile and suitable for a wide range of applications. With the proven clamping device “comfort” the sieve stack can be fastened conveniently with two simple steps. For occasional sieving processes we recommend the inexpensive clamp “standard”.

All clamping devices of AS 200 and AS 300 are also suitable for AS 400.

Tap Sieve Shaker
AS 200 tap

Mechanizing hand sieving

The RETSCH AS 200 tap is suitable for dry sieving with test sieves of 200 mm or 8” diameter. The combination of horizontal, circular sieving motions with vertical taps reproduces the principle of hand sieving. The uniform mechanical action ensures reliable and reproducible measurement results.

This special type of sieving motion used by the AS 200 tap is specified in various standards for particle size analysis of materials such as activated carbon, diamonds, spices, metal powders, abrasives or cement.

AS 200 tap technology

The AS 200 tap is equipped with a powerful single-phase a.c. motor. The sieve plate performs horizontal circular motions with a radius of 14 mm.

The mechanical gear keeps the number of oscillations (280 min⁻¹) as well as the number of taps (150 min⁻¹) constant, even with high loads.

Benefits at a glance

- Sieving with circular motion and vertical taps
- For 200 mm / 8” sieves
- Measuring range 20 µm to 25 mm
- Safe and easy operation
- Robust and maintenance-free
- Sound-enclosure cabinet with CE mark
The AS 200 tap is a robust sieve shaker which requires hardly any maintenance. The compact sound-enclosure cabinet helps to substantially reduce noise emission and ensures CE conformity.

**Accessories for AS 200 tap**

- 6 test sieves (ISO 3310-1), 200 mm Ø, 50 mm height
- 6 test sieves (ASTM E11), 203 mm (8”) Ø, 50 mm height
- Test sieve rack for 10 test sieves 200/203 mm (8”) Ø
- Ball-pan hardness test kit
- 3 sieve stack consisting of 6 test sieves (ISO 3310-1), 200 mm Ø, 50 mm height
- 3 sieve stack consisting of 6 test sieves (ASTM E11), 203 mm (8”) Ø, 50 mm height

**Sieving aids**

For materials that are difficult to separate we recommend the additional use of sieving aids in the individual sieve fractions. Which sieving aid is best suited depends on the mesh size of the sieve and the preselected oscillation intensity. RETSCH offers:

- chain rings,
- balls of agate, rubber or steatite,
- brushes and
- polyurethane cubes.

These mechanical sieving aids destroy agglomerates and dislodge wedged particles from the sieve mesh.
Air Jet Sieving Machine
AS 200 jet

Quick and gentle quality control of fine powders

The Air Jet Sieving Machine AS 200 jet is particularly suitable for low density materials with particle sizes in the lower micron range which tend to agglomerate. It is used with sieves of 10 microns mesh size or more. The procedure is very gentle on the material as no mechanical sieving aids are required. The average sieving time is 2-3 minutes.

Typical applications include construction materials, flour, spices, plastics and pharmaceuticals.

AS 200 jet

The AS 200 jet is specifically designed for test sieves with a diameter of 200 mm/203 mm (8”). The air jet generated by an industrial vacuum can be adjusted by using the manual vacuum regulation. The sieving machine can be optionally equipped with an automatic vacuum regulation which constantly monitors and maintains the air flow thus increasing the reproducibility of the sieving process.

The Open Mesh Function, a procedure which greatly reduces the number of near-mesh particles, provides optimum separation efficiency and excellent reproducibility.

Sieving time and nozzle speed are conveniently set with a single button, the settings are shown in the graphic display. The Quick Start Mode allows to start the sieving process under standard conditions without entering parameters.

The RETSCH software EasySieve® can be used for automated evaluation and documentation.

Benefits at a glance

- Sieving using air jet technology for dispersion and deagglomeration
- Wide measuring range from 10 µm to 4 mm
- Gentle sieving with short sieving times
- Reproducible results due to Open Mesh Function
- Quick Start Mode for easy operation
- Suitable for RETSCH standard sieves Ø 200 mm/203 mm (8”)

AS 200 jet technology

A vacuum cleaner which is connected to the sieving machine generates a vacuum inside the sieving chamber and sucks in fresh air through a sound absorber. When passing the narrow slit of the nozzle, the air stream is accelerated and blown against the sieve mesh. Above the mesh, the air jet is distributed over the complete sieve surface and is sucked in with low speed through the sieve mesh. Thus the finer particles are transported through the mesh openings into the vacuum cleaner or, optionally, into a cyclone.
Air Jet Sieving Machine AS 200 jet

The AS 200 jet is preferably used with sieves of 25 mm height. When the particles are dispersed by the jet of air, they hit the perspex lid and deagglomerate – the shorter the distance, the better the deagglomeration. 50 mm sieves are only used for very sensitive materials.

The delivery scope of the AS 200 jet includes a manual vacuum regulation (1), two sieve lids (2), a sound absorber (3) and a rubber mallet.

RETSCH offers a special vacuum cleaner to be used with the AS 200 jet. It is powered by the sieving machine and is automatically switched on when the sieving process is started. The AS 200 jet can also be equipped with any other industrial vacuum cleaner (<1200 W) with an IEC connector and a suction tube with an outer diameter of 32 mm.

To extend the service life of the filters in the vacuum cleaner and for recovery of the sample fraction passing the sieve, we recommend the use of the optional cyclone. The separation degree and limiting particle size respectively depend on the sample characteristics.

For test sieves please refer to our website www.retsch.com/sieves

**Recommended material quantities**

The maximum batch a sieving machine can process depends on various factors such as number and aperture size of the sieves, maximum grain size and width of distribution of the sample. The standard DIN 66165 provides more details, e.g. the maximum amount of oversize grain which should remain on a square decimeter of sieve bottom.

Examples for the maximum batch and permitted sieve oversize for 200 mm Ø sieves:

1. One-piece sieve frame and fabric-transition without grooves prevent cross contamination (no sample residues etc.).

2. No hollow spaces which need to be sealed (no epoxy).

3. High degree of corrosion resistance and easy cleaning thanks to high-alloy stainless steels.

5. Excellent product quality due to extensive optical inspection.

6. Maximum stability and optimum sealing when used in sieve stacks thanks to the o-ring which is placed in the recess designed for this purpose.

7. Clear and precise labeling of the sieves with full traceability based on individualized laser engraving.

With Ø of 200 / 203 mm (8“)

The unique manufacturing process of RETSCH test sieves with a one-piece stainless steel sieve frame guarantees unrivaled stability and consistency for your sieving application. Paying close attention to mesh size and other specific requirements, the sieve fabric is precisely joined into the frame. Using a unique technology, which is only found in RETSCH test sieves, the fabric is then permanently and reliably tautened. The individual laser engraving of each RETSCH test sieve provides a clear and precise labeling with full traceability.

The sieves can be combined with all other sieve brands without any problems. Please note: Each sieve that leaves our company includes a test report or, at your request, a special inspection certificate in conformity with national and international norms. RETSCH calibration certificates confirm a great number of precision measurements, thus ensuring an even higher statistical reliability for your quality management.

RETSCH test sieves are available in many sizes and varieties, primarily in the four frame sizes most widely used in laboratory analytics: 200 x 50 mm, 200 x 25 mm, 203 x 50 mm (8”x 2”), 203 x 25 mm (8”x 1”).

* ASTM supplementary values

With Ø of 100 / 150 / 305 (12") / 400 / 450 mm

- Sieve meshes, frames and labeling comply with standards
- Tested 5 times, with test report
- According to ISO, ASTM, BS
- Individual inspection certificate for test materials monitoring according to ISO 9000 ff available on request
- Stainless steel wire sieve mesh, 20 µm to 125 mm
- Also available with perforated plate, round or square

Sieve accessories

For the various test sieves, matching:

(A) collecting pans
(B) collecting pans with outlet
(C) intermediate pans
(D) intermediate rings
(E) venting rings and
(F) sieve lids are available.

Sieving aids and sieve racks complete the range of accessories. Please refer to our website www.retsch.com/sieves for order data of the test sieves and the available accessories.

Tested quality – with certificates

Every RETSCH high-quality sieve receives a test report before it is delivered.

On request, an inspection certificate according to DIN ISO 3310-1 or ASTM E11 is available, too, which documents the measuring results in tabular and graphical form. The calibration certificate provides even more statistical details.

As a special service RETSCH offers recalibration of the test sieves. After the standard measuring process of the sieves, all relevant data are recorded and confirmed in the certificate.
Control, evaluation, documentation with EasySieve®

Simple, fast, and reliable
EasySieve®, the software for particle size analyses, exceeds manual evaluation in many aspects. The software is able to automatically control the necessary measurement and weighing procedures – from the registration of the weight of the sieve to the evaluation of the data.

Due to the logical design of the software the user can easily get started with the program and is lead through the process step by step. Moreover, the abundance of evaluation possibilities allows for absolute flexibility with regard to adjustment to individual tasks.

An example of a particle size analysis using EasySieve®

1. Parameter entry
   All available parameters (such as sieve stack configuration, dead weight of the sieve, sieve shaker settings) as well as the characteristics, which may have to be calculated, can be entered by clicking with the mouse in the corresponding fields. Routine parameters can be entered, edited, saved and recalled at a later time. Product specific settings of the measurement parameters are saved and ensure a productive workflow.

2. Sieve analysis
   The program accepts automatic and manual data entries from both scale and sieve system. All RETSCH sieve shakers of the series “control” can be automatically controlled with EasySieve®.

   After the sieve analysis is completed, the loaded sieves are reweighed. By determining the weight difference, the program automatically detects the mass proportions and assigns them accordingly to the corresponding fractions. All data are immediately available for further processing.

3. Evaluation
   The EasySieve® software calculates all common particle distributions as well as the characteristic values of the particle size, thus making it possible to present the results in standard presentation forms, such as tables and charts. Cumulative throughput or residual values, distribution density and histograms can be included in the standard particle size distributions. In addition to this, the program allows for a trend analysis of production procedures, averaging and much more. Last but not least, fineness and distribution characteristics as well as standard parameters can be selected.
Benefits at a glance

- Automatic registration, evaluation and administration of measurement data
- Logical design, self-explanatory
- Measurement protocol in accordance with standards
- Complex presentation of the results in charts and tables
- Easy selection and configuration of common analytical scales
- Comprehensive data export
- Manual on CD-ROM
- English and German

4. Data export
All measured data can be printed, saved and exported as tables and charts. Furthermore, the data can be processed using other software applications such as Excel, Word, PowerPoint and Acrobat Reader, or can be exported as ASCII files. Automatic transfer into the LIMS system is also possible with EasySieve®. Data import and export for modern optical particle size analyzers such as the CAMSIZER® from Retsch Technology is quick and easy.

System requirements

- Pentium PC
- for automatic control:
  - PC with free serial interfaces/USB interfaces
  - sieve shaker with serial interface
    (e.g. AS 200 control, AS 300 control, AS 450 control, AS 400 control, AS 200 tap, AS 200 jet)
  - scale with serial interface
- A RS 232-USB Adapter is part of the delivery scope.
Solutions for more efficient sieve analyses

RETSCH products are used in the quality control of solids for a reason. From representative sample division to precise particle size analysis to professional maintenance of the test sieves – RETSCH offers a complete equipment range for perfect results:

Sample Dividers PT 100, PT 200, RT 6.5 - RT 75

Sample dividers are essential for the exact and representative division of pourable bulk goods in the laboratory. The Rotary Divider PT 100 uses the most exact division method which produces the smallest qualitative variations. In addition to the PT 200, which divides larger amounts up to 30 l per run, RETSCH offers the sample splitter RT for manual division.

Fluid Bed Dryer TG 200

The Fluid Bed Dryer TG 200 is used in the laboratory for the gentle drying of bulk materials without localized overheating. The average drying time lies between 5 to 20 minutes which represents a substantial saving in time compared to other drying methods. Typical materials include coal, plastics, soils, pharmaceutical products or plant materials. The TG 200 can also be used for drying test sieves.

Ultrasonic Baths UR 1, UR 2, UR 3

RETSCH ultrasonic baths are used for the gentle and efficient cleaning of test sieves, glass and metal parts, metallographic and geological samples and many others. Further areas of application are sample preparation of suspensions (e.g. for wet sieving), dispersions in chromatography or the degassing of solutions.

For more details on our sample dividers, rapid dryers and ultrasonic cleaning baths see our “Assisting” brochure.
